MODEL:
DI3M-2.4T-FM

Max continuous power dissipation: 2.0 HP (1.5 kW)
Max continuous brake torque: 134 in-oz. (95 N-cm)
Max brake speed: 15,000 RPM

1. OVERVIEW
This data sheet is a reference for the performance specifications of the dynamometer models listed on the cover page.

The MBS dynamometers may be used to test just about any type of motor (i.e. electric, hydraulic, pneumatic, reciprocating). Types of testing include: endurance testing, speed versus torque curves, measure stall torque, efficiency, temperature rise, performance verification, etc. MBS dynamometers are sold as complete systems (shown in image below) that include: the dynamometer, controller, computer with software, calibration weight, manual and all cables. Our systems do not require annual fees, licenses or permits. The software is user friendly, is very configurable (i.e. changing units, display scale limits, data acquisition rate, etc.) and has some safety precautions build in to prevent damage to the motor under test and/or the system (i.e. brake temperature sensor, setting current limit, setting power limit, trigger input signals).

The nomenclature of the dynamometer part number is described at the end of this document. The power dissipation rating for this system is located on the bottom of the cover page. This data sheet may also be used to determine the best configuration for a system.

Dynamometers, or more specifically the size of the brakes for the dynamometers, are selected based on the required power dissipation and required torque.
The DI3M-2.4T-FM is a direct drive system where one of the brakes may be un-coupled to test smaller motors; the load cell measures the motor torque.

Dynamometers, or more specifically the brakes for the dynamometers, are sized based on the required power dissipation and required torque. The benefit of this dynamometer as an inline system is the ability to test much higher speeds than an off the shelf transmission can handle.

The torque, speed, voltage and current ranges (and types; i.e. DC, AC) need to be specified when purchasing a dynamometer in order to select the limits for the instrumentation. The following performance specifications for load cells, transducers, etc. are based on vendor specifications.

Table 2: Torque, Speed and Power (SI Units)

The tables are based on the performance graph for the MBZ-2.4 Brake, shown in Figure 1. The 2.4 model brake has been known to operate up to 20,000 RPM but no data is available above 15,000 RPM.

4. LOAD CELL (DI3M-2.4T-FM, Measure Motor Torque)

Load Cell Load Rating .............................................. 212 oz. (6 kg)
Arm Length ............................................................ 1.0 inches (2.54 cm)
Max Brake Torque ...................................................... 134 in·oz. (94.6 N·cm)
Max Torque to L.C ..................................................... 212 in·oz. (150 N·cm)
Non-Linearity ........................................................... 0.02% of R.O.
Hysteresis ............................................................ 0.02% of R.O.
Non-Repeatability ..................................................... 0.02% of R.O.
Zero Balance .......................................................... ±1% of R.O.
Compensated Temperature Range .................................... 14°F to 104°F
Safe Temperature Range ............................................. 14°F to 140°F
Temperature Effect on Output .................................... 0.002% of Load/°F
Temperature Effect on Zero ...................................... 0.002% of Load/°F
Safe Overload ......................................................... 150% of R.O.*

* Hard stops are in place to help prevent damage from over-load.
4.1 Load Cell Accuracy Plot (in-oz.)

The Torque Error plot shows the percentage error as a function of measured torque. These plots show the range that a load cell will accurately measure. The maximum torque to the motor is based on the maximum torque from the brake. The error plot is based on published data from the load cell vendor.
4.2 Load Cell Accuracy Plot (N-cm)

The Torque Error plot shows the percentage error as a function of measured torque. These plots show the range that a load cell will accurately measure. The maximum torque to the motor is based on maximum torque from the brake. The error plot is based on published data from the load cell vendor.
5. **SPEED MEASUREMENT**

A standard brake has five magnets (alternative quantity are optional) which trigger a hall effect sensor. The speed is averaged over one revolution of the brake. A 48-MHZ clock is used to measure the time between magnets.

<table>

</tr>
</tbody>
</table>

* Theoretical speed; actual maximum speed is limited to the speed of the brake.

6. **DATA SAMPLING**

Sampling is the frequency of measuring and recording data; this rate is adjustable by the operator.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Conditions</th>
<th>Min.</th>

</tr>
</tbody>
</table>

8. **POWER REQUIREMENTS**

The MBS Dynamometer requires two 115 or 230 VAC power outlets: one for the laptop computer and one for the controller. The brakes in the dynamometer structure receive power from the controller.

<table>

13. DYNAMOMETER LAYOUT – DB3M-2.4T-FM, LOAD CELL ON MOTOR

[Diagram of Dynamometer Layout]

NOTES:

1. DYNAMOMETER WEIGHT = 30 LBS.
14. MOTOR MOUNTING PLATE

Diagram showing motor mounting plate dimensions and notes:

1. Plate to be modified to suit customers' requirements.
2. N/A: CS64-0009, CS64-0110.
15. DYNAMOMETER CONTROLLER
16. NOMENCLATURE OF DYNAMOMETER PART NUMBER

DB5M-8.7T-FM

Motor Mounting Style:
- FM = Face Mount
- BM = Base Mount
- CB = Carriage Base

Number of Brakes:
- T = Tandem System
- Omitting T = single brake system

Brake Size:
- 17.5 = MBZ-17.5 brake
- 8.7 = MBZ-8.7 brake
- 5.7 = MBZ-5.7 brake
- 3.7 = MBZ-3.75 brake
- 2.4 = MBZ-2.4 brake

Load Cell Location:
- M = Measuring Motor Torque
- B = Measuring Brake Torque

Centerline Distance:
- 3 = 3 inches from top of baseplate to centerline of motor shaft.
- 5 = 5 inches from top of baseplate to centerline of motor shaft

System Type:
- B = Belt Coupled system
- I = Inline system
- D = Dynamometer

The load cell(s) size(s) and type(s) of voltage & Current transducers are to be specified individually.
